

Technical Analysis of Hindustan Aeronautics Ltf

Aryan Dhamdhare
(24b2513)

Hindustan Aeronautics Limited (HAL) is one of India's largest defence and aerospace companies, playing a key role in the country's indigenous military manufacturing. It is a Nifty 50 and Sensex constituent, making it an important player in the Indian stock market.

HAL's stock (traded as HAL.NS on NSE) is known for its strong fundamentals, high institutional ownership, and strategic importance. In recent years, HAL has expanded its focus from traditional aircraft manufacturing to advanced platforms like fighter jets, helicopters, UAVs, and jet engines—aligning with India's push for defence indigenisation and self-reliance.

1. Using RSI

Here we can see that RSI is around 43, which indicates weakening momentum but not yet oversold. Since it is below the neutral 50 level, it suggests that the stock is losing strength. However, $RSI < 50$ is not a clear sell signal on its own.

2. Using a Doji

Presence of a Doji indicates market indecision, which often precedes a trend reversal. If a Doji appears after a strong **uptrend**, it may signal that the buying momentum is weakening, potentially leading to a **downtrend**. Conversely, if it appears after a **downtrend**, it can suggest that selling pressure is easing, and a **reversal to an uptrend** may follow. However, confirmation from the next candlestick and other indicators is essential before making a trading decision.

3. Bullish Engulfing Pattern followed by RSI breakout confirms potential reversal

Around the middle of the chart (between 13th and 14th), you can see a Bullish Engulfing Candlestick — a strong green candle that completely engulfs the previous small red candle. This pattern indicates a potential bullish reversal, showing that buyers have taken control after a downtrend.

At the same point, the RSI starts rising sharply from the oversold region (~30), indicating increasing bullish momentum and supporting the reversal.

Together, this candlestick pattern + RSI bounce gives a buy signal or at least a caution to exit short positions.
